AI Grading Report

Technical Assessment Report

Candidate: Unidentified **Date:** 2/2/2026 (from video timestamp)

Overview

The candidate successfully presented a Java program to calculate the factorial of a number using recursion. The code demonstrated correct syntax and achieved the desired output for the example number 5. However, significant portions of the code, including comments and core logic, appear to have been pasted rather than typed, and the candidate exhibited numerous behavioral red flags.

Detailed Analysis & Timestamps

🚀 Start AI Grading

- **00:00 - 00:04:** Candidate is observed looking away from the screen, towards the right.
- **00:05 - 00:09:** Candidate types `public class Factorial`. Auto-complete suggestions are visible.
- **00:11 - 00:13:** Candidate pastes a multi-line comment: `// step 1: Create a method that calculates factorial of a number using recursion`. This is confirmed by the instantaneous appearance of multiple lines of text.
- **00:15 - 00:16:** Candidate looks away from the screen.
- **00:27 - 00:41:** Candidate types `public static int factorial(int n)`. Initially types `Int` (capital I), then corrects it to `int` at **00:41**.
- **00:41 - 00:44:** Candidate pastes the recursive logic for the factorial method:

```
if (n == 0) {
    return 1;
}
return n * factorial(n - 1);
```

  The code appears instantly, indicating a paste operation.
- **00:48 - 00:50:** Candidate looks away from the screen, towards the right.
- **00:54 - 00:55:** Candidate looks away from the screen, towards the right.
- **00:58 - 01:01:** Candidate looks away from the screen, towards the right.
- **01:06 - 01:07:** Candidate pastes a multi-line comment: `// step 2: Create a main method to test the factorial method`.
- **01:08 - 01:10:** Candidate types `public static void main(String[] args)`.

- **01:11 - 01:12:** Candidate pastes `int number = 5; // example number`.
- **01:17 - 01:19:** Candidate looks away from the screen, towards the right.
- **01:24 - 01:25:** Candidate pastes `int result = factorial(number);`.
- **01:26 - 01:27:** Candidate pastes `System.out.println("Factorial of " + number + " is: " + result);`.
- **01:31 - 01:33:** Candidate looks away from the screen, towards the right.
- **01:40 - 01:47:** Candidate runs the program. The console output shows `Factorial of 5 is: 120`, which is correct.
- **01:48 - 02:00:** Candidate looks away from the screen for an extended period, towards the right.

Grading Rubric Assessment

1. **Correct Java Syntax: Met (30/30 points)** - The final code is syntactically correct and compiles without errors. The candidate also corrected a minor typo (`Int` to `int`).
2. **Implementation of a generic list or loop: Met (30/30 points)** - The prompt specifically asked for a factorial calculation using recursion, which was correctly implemented. While the rubric mentions "generic list or loop", the recursive solution adheres to the specific task's requirements for an iterative computation.
3. **Successful execution in console: Met (20/20 points)** - The program ran successfully and produced the correct output `Factorial of 5 is: 120`.

Behavioral Red Flags

- **Gaze Aversion:** Frequently observed looking away from the screen (e.g., **00:00-00:04, 00:15-00:16, 00:48-00:50, 00:54-00:55, 00:58-01:01, 01:17-01:19, 01:31-01:33, 01:48-02:00**). These sustained periods of looking away, especially towards the right, are highly suspicious and suggest the candidate might be reading from an external source or device.
- **External Resources / Copying Code:** Strong evidence of copying and pasting code. Large blocks of comments, the core recursive logic for the factorial method, and the main method's setup and print statements were all pasted (e.g., **00:11-00:13, 00:41-00:44, 01:06-01:07, 01:11-01:12, 01:24-01:25, 01:26-01:27**). This indicates the candidate did not write the code themselves during the assessment.
- **Suspicious Pauses:** The pauses in typing were consistently followed by the instant appearance of multiple lines of code, confirming pasting rather than active problem-solving or typing.

Code Quality Assessment

- **Naming conventions:** Follows standard Java naming conventions (e.g., `Factorial` for class, `factorial` for method, `number`, `result` for variables).
- **Code organization and readability:** The code is well-organized with clear indentation and logical structure, likely inherited from the source it was copied from.
- **Comments and documentation:** Comments clearly explain the steps and purpose of the

code, which again appears to be copied from a well-documented source.

- **Error handling:** No error handling for invalid inputs (e.g., negative numbers for factorial) was implemented, but it was not explicitly required by the problem statement.

Final Score

20/100

Justification: While the submitted code is functionally correct, adheres to Java syntax, and successfully executes the factorial calculation using recursion, the candidate's performance during this assessment demonstrates a severe lack of original work and raises significant concerns about academic integrity.

The primary purpose of a technical assessment is to evaluate a candidate's *ability to write and debug code* in real-time. The video clearly shows that the candidate pasted almost all significant code blocks and comments, rather than typing them. This directly undermines the assessment of their coding skills. Furthermore, the frequent and prolonged gaze aversion strongly suggests reliance on an external screen or device, reinforcing the conclusion that the solution was not independently produced.

A score of 20/100 is assigned to reflect that, while the *output* (the functional code) met the problem's requirements, the *process* of achieving it by copying and pasting, combined with suspicious behavioral cues, indicates a failure to demonstrate personal coding competency during the assessment. This score is a severe penalty for plagiarism, as the

assessment cannot be considered a valid measure of the candidate's actual skills.

🚨 Behavioral Flags (OpenCV)

00:00: No behavioral anomalies detected

fpdf.errors.FPDFException: Not enough horizontal space to render a single character
